This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6:	used as a driver in a hybridization with the UI-R-Cl library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography,	the mixture. The subtracted library (UT-R-C2p) was constructed as follows: PCR amplified cDNA inserts from UT-R-C1 clones from which 3' ESTs had been derived was	kidney, heart, spleen ovary muscle, 8, 12 and 18 day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows	library, which is a subtracted library derived from the UI-R-CO library. The UI-R-CO library consisted of a mixture of individually terminalized libraries constructed from rat placents.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This PCR primer (with primers AAT79541-44) flanks the TATA box sequence cupstream of the wridine diphosphate glucuronosyltransferase (UGT) gene CL 1*1 exon 1 (see AAT79540), and was used to amplify fragments of 253-255 CC bp. This gene is known to be associated with Gilbert's syndrome (GS). GS CL is a mild, common form of unconjugated hyperbilirubinaemia associated with reduced bilirubin glucuronidation capacity. Analysis of the genetic chasis of GS has allowed 2 forms to be identified. One is a mild form CC associated with a homozygous 2 bp insertion in the TATA sequence cupstream of the GCT1*1 exon 1, and the other is a more severe form CC associated with heterozygosity for a mutation which, when homozygous, CC causes Crigler-Najjar type 2 disease. The first form is autosomal causes Crigler-Najjar type 2 disease. The first form is sutosomal causes Crigler and the second is inherited dominantly. Patients suffering from CG S, which is benign, may have altered metabolism of some drugs, making it clifficult to determine if an effect is due to the drug or the syndrome. CC upstrial efficiency would be improved if potential participants can be screened for the genetic basis of GS, and eliminated or included on hasis of them proceeding the control of them capacity is a control of them capacity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC Nucleotide sequences AAZ45110-Z45118 are exons 1A-1J of the human CC unidate diphosphate-glucuronosyltransferase 1 (UGT1) gene. The UGTs are a CC family of enzymes that catalyse the glucuronic acid conjugation of a wide CC range of endogenous and exogenous substrates including phenois, CC result in toxic substances being converted to compounds which are more CC vater soluble and are excreted. The invention relates to and identifies CC UGT1 polymorphisms (AAZ45004-Z45041). The polymorphisms sequences are CC useful as probes for detecting UGT1 locus polymorphisms are associated attered UGT1 expression or activity. These polymorphisms are associated CC with crigler-Najjar and Gilbert syndromes (unconjugated thyperbilirubinamia) and drug metabolism. The genotyping of the UGT1 gene is used to predict the rate of metabolism of UGT1 substrates, possible crug-drug interactions and adverse side effects (i.e. to optimize drug consequences, including polymorphisms, can also be used to produce the corresponding protein (or its fragments) or to generate transgenic animals or modified cells e.g. for pharmacogenetic screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

CC (4) Exon 3, represented in AAQ33026;
CC (4) Exon 4, represented in AAQ33026;
CC (5) Exon 5, represented in AAQ33027; and
CC (6) about 69 kb of non-sequenced DNA.
CC Six unique N-termini of 286-289 amino acids are encoded by the six different first exons and identical C-termini of 246 amino acids are encoded by the common exons 2-5. The UGT1 gene locus encodes a family of UDP-glucuronosyl transferase isozymes, two of which metabolise bilirubin.
CC Patients having Crigier-Najjar Syndrome (CN) Type I, have a mutation present in the second common exon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Antibodies accident are useful for treating strong A Streptococcus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequencis a DNA encoding partial GRAB protein from S. pyogenes strain KTL3. The protein has alpha2M binding region and is useful in vaccine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polynucleotides which are useful for preventing, treating or ameliorating comedical conditions, e.g. by protein or gene therapy. Pathological conditions can also be diagnosed by determining the amount of the secreted polypeptides in a sample or by determining the presence of utations in the polynucleotides. Specific uses are described for each of the products, based on which tissues they are most highly or treatment of cancer, tumours, neurodegenerately described storders, developmental abnormalities and foetal deficiencies, blood disorders, CNS disorders, diseases of the immune system, autoimmune diseases, hepatic and renal disease, dishetes, inflammation, allergies, ischemic shock, Alzheimer's and cognitive disorders, schizophrenia, cardiovascular disorders, arthritis or malignancies, diseases of testes, lung or thymus, digestive/endoctine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding partners.
                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This DNA sequence encodes a novel soluble toxin (see AAW60227) of Bacillus thuringlensis (B.t.) strain ps:96573 (NRRL B-21872). This contains that thave toxin belongs to the novel MIS-6 family of B.t. toxins that have toxicity against non-mammalian pests. The novel DNA was obtained by POR amplification (see AAW30298-99) of total cellular genomic DNA. It can used to produce recombinant hosts (preferably plant or bacterial) that express the toxin, or as a PCR primer or hybridisation probe for use in identifying and characterising MIS-6 family toxin genes. Disclosed and claimed are novel B.t. isolates and toxins (see AAW60218-32) which have activity against lepidopteran and/or coleopteran pests, isolated genes, probes and primers (see AAW30288-321 and AAW39734-87), and transformed host including MIS-6, from B.t. isolates. MIS toxins are also useful for their ability to form pores in cell membranes, and can be used to facilitate entry of a second agent into a target cell.

Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMs or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated LDL-receptor related protein - used to develop products for treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Caskey CT, Cox RD,

Phillips
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases, such as slomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention can also be used for detection, diagnosis and

sequence represents the putative open reading frame of LRP5 isoform 3. CC Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining CC if an individual is susceptible to insulin dependent diabetes mellitus CC (IDDM). The NAMS or proteins can be used for reducing triglyceride levels CC in the serum of an individual. Therapies that affect LRP5 may also be CC useful in the treatment of autoimmune diseases such as CC glomerulonephritis diseases and disorders involving disruption of CC endocytosis and/or antigen presentation, cytokine clearance and/or CC inflammation, viral infection, pathogenic bacterial toxin contamination, cc elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, CC osteoporosis, Alzheimer's disease and cardiovascular disease. Products CC from the present invention can also be used for detection, diagnosis and CC drug screening.
  New isolated LDL-receptor related protein - used to develop for treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 1998-594573/50.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). The present sequence represents the LRP5 isoform 5 cDNA.

Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMs or proteins can be used for reducing triglyceride level in the serum of an individual. Therapies that affect LRP5 may also be useffin to the treatment of autoimmune diseases such as
                                                                                                                                  Caskey CT, Cox RD, Ge Hey P, Kawaguchi Y, I Phillips MS, Todd JA,

The present invention describes LRPS (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). The present sequence represents the Lrp5 isoform 3 cDNA.

Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus

Example 1; Fig 12a; 200pp; English.

Claim 3; Fig 5a; 200pp; English.

Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMs or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be
                                                                                                                                 for treating, e.g. elevated trigity autoimmune disorders, inflammation
                                                                                                                                   New isolated LDL-receptor related protein - used to develop products for treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease

useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving d
                           receptor related protein, previously designated LRP-3). The present sequence represents the LRP5 isoform 6 cDNA.

Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride level in the serum of an individual. Therapies that affect LRP5 may also be
                                                                                                                                                                                       New isolated LDL-receptor related protein - used to develop products for treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                      Caskey CT,

Best Local ;
receptor related protein, previously designated LRP-3). The present sequence represents the LRP5 isoform 2 cDNA.

Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes melitus (IDDM). The NAMS or proteins can be used for reducing triglyceride level in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endcoytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, costeoporosis, Alzheimer's disease and cardiovascular disease. /rpt 221.	The clone RP11-154L24 contains a tandem repeat from base positions 38234 to 39039, this region contains some low quality data. The assembly is consistent with the restriction digest information. Location/Qualifiers 1. 68770 /organism="Homo sapiens" /db_xref="taxon:9806" /chromosome="2" /clone="RP11-154L24" /clone="RP11-154L24" /clone="lib="RPCI-11"	SOURCE INFORMATION: The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osocegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An Improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from and coworkers at the Roswell Park Cancer Institute (http://www.resgen.com) or Pieter de Jong (http://bacpac.med.bufalo.edu) vccror: pBACe3.6 (http://bacpac.med.bufalo.edu) vccror: pBACe3.6 The clone sequenced to the left is RP11-332L11, 200 bp overlap. Actual start of this clone is at base position 86134 of RP11-154L24.	MAPPING INFORMATION: Mapping information for this clone was provided by Dr. John D. Mapping information for denetics, Washington University, St. Louis MCD. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc	This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >- 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.	NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.	anome Center Ington University Genome Sequen WUGSC tp://genome.wustl.edu/gsc tens@watson.wustl.edu unmary Statistics ct name: H_NH0154L24	ted (21-1 sity, 444 13, 1999		to 68770) ission 22-007-1999) Department of Genetics, Washingto	one pre

Gaps between the courty are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Large Scale Sequencing of the Chromosome 16 region q24.3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 ccactgggatcaacagtatct
                                                                                                                    buring sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above. This sequence has been finished according to sequence map oriteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known the sequence map or the such as compressions and repeats, but not necessarily within known the sequence map or the s
                  The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
                                                                                   annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                       Direct Submission

COMMENT

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >-30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

Mapping information:
Mapping information for this clone was provided by Dr. John D.
Mapping information of Genetics, Washington University, St. Louis
Mcherson, Department of Genetics, Washington University, St. Louis
MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc

The clone sequenced to the left is RP11-332L11, 200 bp overlap. Actual start of this clone is at base position 86134 of RP11-332L11, actual end is at base position 68770 of RP11-154L2 donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute SOURCE INFORMATION:
The RPCI-11 human BAC library was made from the blood of one male NEIGHBORING SEQUENCE INFORMATION: http://bacpac.med.buffalo.edu)

The clone RPI1-154L24 contains a tandem repeat from base positions 38234 to 39039, this region contains some low quality data. The assembly is consistent with the restriction digest information. Location/Qualifiers

RP11-154L24.
